

SECTION 12.0

OPERATING EXPENSES

12.1 Introduction

The estimation of operating expense in BCPM 3.0 is the result of a straightforward application of user-adjustable expense factors. The user can specify values for every expense factor used by BCPM 3.0, whether in the form of expense per dollar of investment or expense per access line. For the most part, these factors are applied directly to investment estimated by the Model as simple multipliers.

12.2 Operating Expense Methodology

BCPM 3.0 allows the user to specify operating expenses as either a per access line amount or as a percent of investment. The Model is flexible so that the user can specify a subset of account operating expenses on a per-line basis with the remainder specified as a percent of investment, according to the user's preferences regarding the appropriate application methodology.

The expense accounts used by BCPM 3.0 are as follows:

Network Support:	6110 Total Network Support
General Support:	6120 Total General Support
CO Switching:	6212 Digital Electronic
CO Transmission:	6232 Circuit Equipment
Information Orig/Term:	6310 Total Information Orig/Term
Cable and Wire Facilities:	6411 Poles
	6421.1 Aerial Copper Cable
	6421.2 Aerial Fiber Cable
	6422.1 Underground Copper Cable
	6422.2 Underground Fiber Cable
	6423.1 Buried Copper Cable
	6423.2 Buried Fiber Cable

	6441 Conduit Systems
Plant Nonspecific Operations:	6510 Other Property, Plant and Equipment
	6530 Total Network Operations
Customer Operations:	6610 Total Marketing
	6620 Total Services
Corporate Operations:	6710 Total Executive and Planning
	6720 Total General and Administrative
Uncollectibles:	6790 Provision for Uncollectibles
Taxes:	7240 Other Operating Taxes

The application of the expense factors is straightforward. If a per-line expense factor is specified, then total operating cost for the relevant account is simply a function of the number of access lines. If a percent-of-investment factor is specified, then total operating expense is a function of investment, usually of that in the relevant account.

As with support factors, BCPM 3.0 allows the user to specify operating expense factors for three size classifications of companies: small, medium, and large. The Model also allows the user to differentiate between operating expenses pertinent to serving business customers and those relevant to serving residential customers.

SECTION 13

REPORT MODULE

13.1 Introduction

The Report Module provides the final step in the process of developing universal service support levels. In the module, cost factors, including depreciation, return and taxes, are combined with operating expenses to generate monthly costs. Monthly costs are then used to calculate universal service support for a given benchmark. These support levels are available at the grid, wire center, company, or state level.

13.2 Report Example

As an example, a state level summary would contain the following information:

Investment Per Line Data (including capped⁴³ and uncapped annual amounts)

(The following four categories are added to produce the Total Investment)

Loop Investment
+ Switch Investment
+ IOF Investment
+ Other Investment
Total Investment

Expenses Per Month Data (including capped and uncapped amounts)

(The following two categories are added to produce the Total Cost Per Line)

Total Capital Costs Per Line
+ Total Operating Expenses Per Line
Total Cost Per Line

⁴³ Grids with Average Loop Investment per line over \$10,000 are capped at \$10,000 as a default value when invoking the cap on loop investment. The user has the option to set a different cap value at a national level or by entering the cap at the wire center level in the FCC Lines file. The results of that value would be reported here in addition to the uncapped value.

Gross Receipts Tax⁴⁴

Line Data

Average Loop Length in Feet

Lines Above \$10K Loop Investment

Number of Households

(The following four categories are added to produce the Total GRID Lines Served)

Number of Residential Lines

+ Number of Single Business Lines

+ Multiple Business Lines

+ Non Switched Lines

Total GRID Lines Served

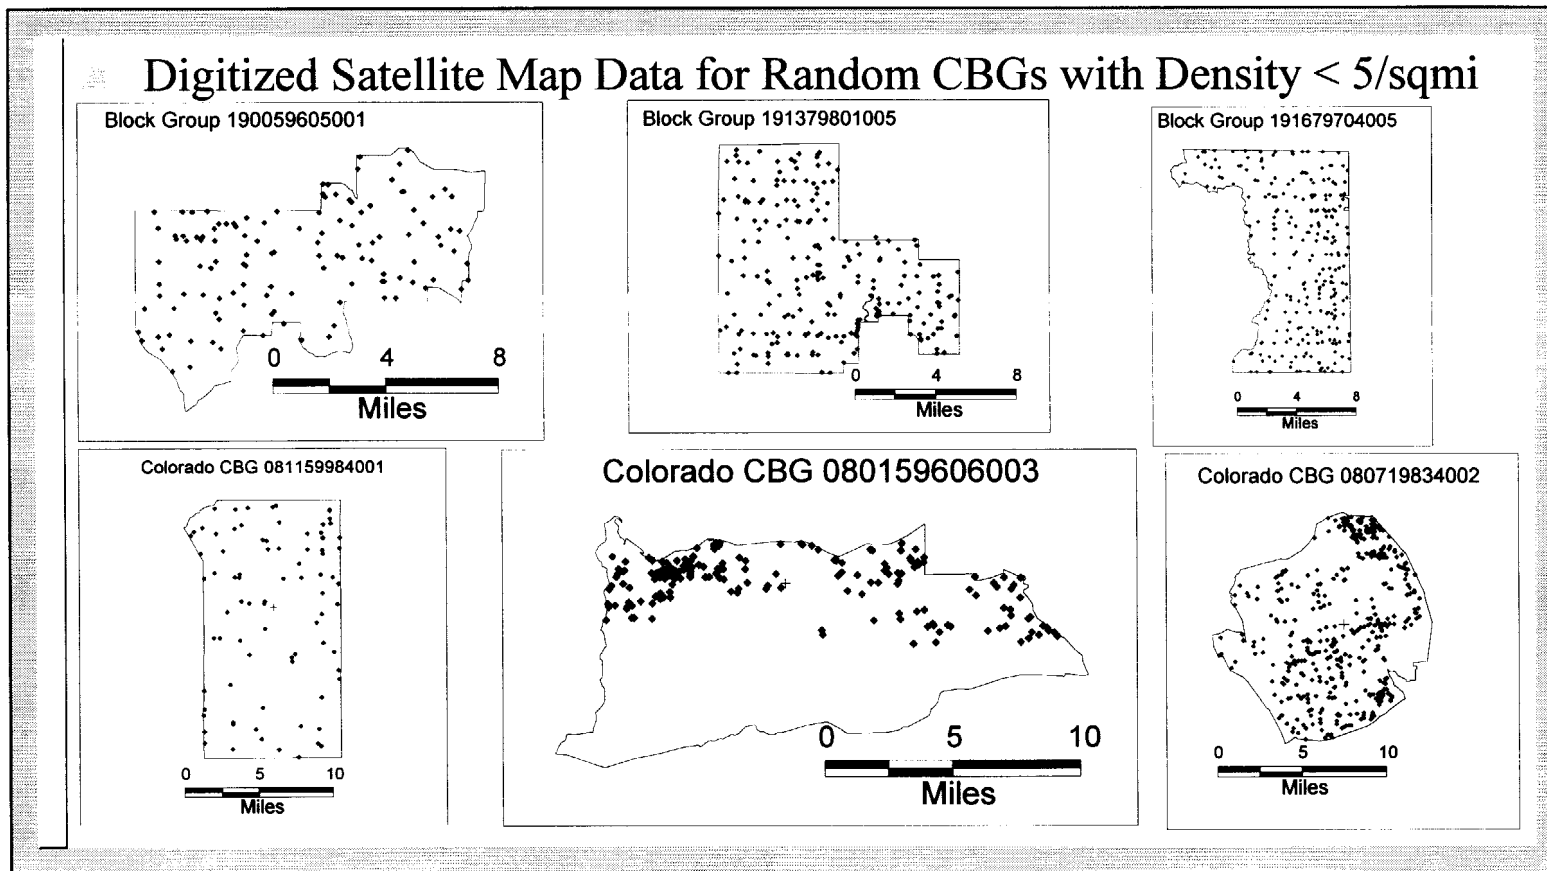

⁴⁴ Since Gross Receipts Tax rates vary substantially from state to state, they are not included in the monthly cost.

APPENDIX B

BCPM 3.0 DATA SPECIFICATIONS

The following summarizes the data to be provided for the BCPM 3.0 model. This data is provided as a set of comma-separated variable ASCII text files. For each of 50 states (in Alaska, for the Anchorage area only), the District of Columbia, and Puerto Rico, the following 4 files are produced:

- Base Grid File: Fundamental file, containing attributes and measures for each grid
- Wire Center Terrain File: Auxiliary file, containing terrain attributes of the service area
- Wire Center Information File: Cross reference for wire center as a whole
- CBG-to-Grid Equivalence: Cross reference for CBGs in a service area

Also, a single Telephone Companies' File relates each operating company to its parent company.

Each comma-separated variable file presents character fields without surrounding quotation marks. Spaces freely appear in such character fields, but commas and ampersands never do. When either a comma or ampersand appears in the original data, it is be converted to a space in that field in the output file.

Each comma-separated variable file includes, as its first record, the *Field Names* for the file. Those names appear in this paper, each in parentheses after the descriptive name of the field. The *File Names* also appear, each in parentheses after the file's title line in this paper. Each *ss* is the state abbreviation.

Grids and MicroGrids

The fundamental unit of measurement is the *grid cell*, measuring $1/25^{\text{th}}$ of a degree of latitude by $1/25^{\text{th}}$ of a degree of longitude, somewhat less than 15,000 feet on each side. The fundamental unit in building these grids is a *microgrid cell*, $1/8^{\text{th}}$ of a grid cell on each side (therefore $1/200^{\text{th}}$ of a degree on each side), 64 of these forming a full grid cell.

However, locations and clusterings of subscribers sometimes cause the reporting of information for an *effective grid cell* that is some part of a standard grid cell, or even parts of a standard grid cell augmented by a small part of another. Reporting is done per effective grid cell.

Base Grid File (ssOUT.CSV)

Each of the 50 state files contains one record per *effective grid cell*. The records appear in the following order, from major to minor, all fields in ascending sequence:

Wire Center CLLI Code
FDI Code

Each record of a state's Base Grid file contains the following fields, in the order presented here (names in parentheses are the column names in the file):

- **Wire Center Switch CLLI (*SWCLLI*):** The 11-character code identifying the switch serving this grid cell. The switch and its location are taken from the LERG. The wire center service area is taken from the BLR *Wire Center Premium Package* data files. If more than one switch location serves a wire center service area, each microgrid cell is assigned to the *nearest* switch.
- **Central Latitude of Effective Grid Cell (*CentLat*):** Latitude of the nominally central point of the effective grid cell, presented as degrees with 4 fractional digits.
- **Central Longitude of Effective Grid Cell (*CentLng*):** Longitude of the nominally central point of the effective grid cell, presented as degrees with 4 fractional digits.
- **Area of the Effective Grid Cell (*AreaSqMi*):** The area, presented as square miles with up to 6 fractional digits.
- **Depth To Bedrock in Inches (*RockDepL*):** Minimum depth to bedrock for the effective grid cell, expressed in inches with up to 2 fractional digits. Terrain information is taken directly from *STATSGO* data. If an effective grid cell spans more than one terrain area as defined by *STATSGO*, the attributes of the areas are proportionally weighted ... This is done for the next five measures as well.
- **Rock Hardness (*RockHard*):** Predominant rock hardness for the effective grid cell ... HARD or SOFT, or blank to indicate neither.
- **Surface Soil Texture (*SurfTex*):** Predominant surface soil texture in the effective grid cell, an abbreviation of up to 7 characters.
- **Water Table Depth in Feet (*WTDepL*):** Minimum water table depth for the effective grid cell, expressed in feet with up to 2 fractional digits.
- **Minimum Soil Slope (*SlopeL*):** Minimum soil slope for the effective grid cell, expressed with 2 fractional digits.
- **Maximum Soil Slope (*SlopeH*):** Maximum soil slope for the effective grid cell, expressed with 2 fractional digits.
- **Number of Business Lines (*BusLines*):** Count of Business Lines in the effective grid cell. This number is allocated from PNR Business Lines/Firms data, provided principally at the Census Block Level. Where PNR's data was *not* assigned to the Census Block level (about 15% of those records), we have first *allocated* it to the Census Block level, allocating the higher-level lines and firms to Census Blocks that already have business lines, on a basis proportional to the number each constituent Census block already has. This number, for the

effective grid cell, is apportioned from the numbers for Census Blocks overlapped by this effective grid cell, in general, on a relative area basis ... but for Census Blocks larger than 1/4 square mile, it is apportioned on a relative road segment length basis.

- **Number of Business Firms (*BusFirms*):** Count of Business *Firms* from the same source, allocated and apportioned as above.
- **Number of Households (*HHlds*):** Count of Households in the effective grid cell. The source for this number is the Census Bureau's 1990 figures per Census Block; these numbers are then modified for each Census Block of a county by the Census Bureau's 1995 estimate of population change in that county. This number, for the effective grid cell, is apportioned from the numbers for Census Blocks overlapped by this effective grid cell, in general, on a relative area basis ... but for Census Blocks larger than 1/4 square mile, it is apportioned on a relative road segment length basis.
- **Number of Housing Units (*HUnits*):** Count of Housing Units in the effective grid cell. The source for this number is the Census Bureau's 1990 figures per Census Block; these numbers are then modified for each Census Block of a county by the Census Bureau's 1995 estimate of population change in that county. This number, for the effective grid cell, is apportioned from the numbers for Census Blocks overlapped by this effective grid cell, in general, on a relative area basis ... but for Census Blocks larger than 1/4 square mile, it is apportioned on a relative road segment length basis.

The following ten fields are subdivision of the above Number of Housing Units, indicating the number of housing units in each of several structure sizes and types; with some tolerance for rounding, these 10 numbers – including their fractional digits – should sum to the Number of Housing Units above. The 10 fields are:

- **Number of Housing Units in Single-Unit Detached Structures (*HU1Det*):** Units in the traditional standalone house.
- **Number of Housing Units in Single-Unit Attached Structures (*HU1Att*):** Units that are, for example, garage apartments.
- **Number of Housing Units in Two-Unit Structures (*HU2*):** Units in a duplex.
- **Number of Housing Units in 3- to 4-Unit Structures (*HU3to4*):** Units in typical smallest apartment buildings or triplex or quadruplex.
- **Number of Housing Units in 5- to 9-Unit Structures (*HU5to9*):** Units in typical modest sized apartment buildings.
- **Number of Housing Units in 10- to 19-Unit Structures (*HU10to19*):** Units in larger apartment buildings.
- **Number of Housing Units in 20- to 49-Unit Structures (*HU20to49*):** Units in large apartment buildings.
- **Number of Housing Units in 50-or-Greater-Unit Structures (*HU50Plus*):** Units in very large apartment buildings, typically high-rise.
- **Number of Housing Units that are Mobile Homes (*HUMbl*):** Mobile home units.
- **Number of Housing Units that are None of the Above (*HUOther*):** For example, houseboats.

The record continues with the remaining fields:

- **Latitude of Road Centroid (*RdCentLat*):** For that center point of road segments of this effective grid cell, this is the latitude (the “Y” value).
- **Longitude of Road Centroid (*RdCentLng*):** For each effective grid cell, a center point of road segments is calculated. This is the longitude (the “X” value) of that center point.
- **Distance from Switch (*SWDist*):** Straight-line distance, in feet, of the road centroid of this effective grid cell from the switch that serves this effective grid cell.
- **FDI Code (*FDICode*):** This 7-character code indicates the path and sequence of the feeder, subfeeder, and any part 2 subfeeder used to reach the road centroid of this effective grid cell. The characters of this code are in the form *qbyydz* where:
 - *q* indicates the quadrant: 1=East, 2=North, 3=West, 4=South
 - *b* indicates any main feeder splitting: 0=No split, 1=North/East leg, 2=South/West leg
 - *yy* indicates a relative number (01..99) of this subfeeder, in this direction, off its main feeder
 - *d* indicates direction of subfeeder from feeder: 1=East, 2=North, 3=West, 4=South
 - *zz* indicates a relative number (01..99) of this part 2 subfeeder, off this subfeeder ... If no part 2 subfeeder, this code is 00

In addition, where any main feeder *splits*, a “dummy record” appears with Switch CLLI Code, with an FDI Code of *q099999*, with a Main Feeder Length of **10000**, with terrain values, and with all other fields zero.

- **Length Along Main Feeder (*MainFdrLen*):** Distance, in feet, along main feeder from switch to the point at which this effective grid cell’s subfeeder comes off the main feeder.
- **Length Along Subfeeder (*SubFdrLen*):** Distance, in feet, along subfeeder from point at which this effective grid cell’s subfeeder leaves main feeder to:
 - If a part 2 subfeeder is used, to the point at which the part 2 subfeeder departs from this subfeeder
 - If *no* part 2 subfeeder is used (e.g., inside 10,000 feet), to the road centroid of the effective grid cell itself
- **Length Along Part 2 Subfeeder (*Pt2FdrLen*):** If a part 2 subfeeder is used, distance in feet from point at which part 2 subfeeder departs subfeeder to the road centroid of this effective grid cell ... If no part 2 subfeeder is used, this number is 0.

Each effective grid cell is further partitioned into four *reporting quadrants*, unless the effective grid cell is only the size of a microgrid cell:

- Upper Left Quadrant (UL)
- Upper Right Quadrant (UR)
- Lower Left Quadrant (LL)
- Lower Right Quadrant (LR)

Each effective grid cell record includes information of all four of these quadrants, in the order specified above. For each of the quadrants, the following information appears, unless the effective grid cell is a *microgrid* cell (1/200th by 1/200th), in which case the full set of numbers is presented as the first (UL) quadrant's data, and the numbers for the remaining quadrants are all zero:

- **Quadrant Number of Housing Units (*UL/UR/LL/LRHUnits*)**
- **Quadrant Number of Households (*UL/UR/LL/LRHHlds*)**
- **Quadrant Number of Business Lines (*UL/UR/LL/LRBusLines*)**
- **Quadrant Road Segment Length (*UL/UR/LL/LRRdSegLen*):** In feet
- **Quadrant Road Reduced Area (*UL/UR/LL/LRRdArea*)**
- **Quadrant Road Centroid Horizontal (X) Distance (*UL/UR/LL/LRRdCHDist*):** From grid cell road centroid, in feet
- **Quadrant Road Centroid Vertical (Y) Distance (*UL/UR/LL/LRRdCVDist*):** From grid cell road centroid, in feet

Wire Center Terrain File (*ssWCTRN.CSV*)

There is one record per wire center, in ascending order by wire center switch 11-character CLLI code. The data fields are these:

- **Wire Center Switch CLLI (*SWClli*):** The 11-character code identifying the switch that serves the wire center area.
- **Area of the Service Area (*Area_WC*):** The area, in square miles with fractional digits, of the wire center service area.
- **Depth To Bedrock (Inches) (*Bedrock_Depth_WC*):** Minimum depth to bedrock for the wire center service area, expressed in inches with up to 2 fractional digits.
- **Fraction of Area with HARD Rock (*Rock_Hard_Fr*):** Decimal fraction, 4 fractional digits, indicating portion of wire center service area for which rock hardness is HARD.
- **Fraction of Area with Normal Rock (*Rock_Norm_Fr*):** Decimal fraction, 4 fractional digits, indicating portion of wire center service area for which rock hardness is normal.
- **Fraction of Area with SOFT Rock (*Rock_Soft_Fr*):** Decimal fraction, 4 fractional digits, indicating portion of wire center service area for which rock hardness is SOFT.

- **Surface Soil Texture (*Soil_Type_WC*):** Predominant surface soil texture in the wire center service area, an abbreviation of up to 7 characters.
- **Water Table Depth (Feet) (*Water_Depth_WC*):** Minimum water table depth for the wire center service area, expressed in feet with up to 2 fractional digits.
- **Minimum Soil Slope (*Slope_Min_WC*):** Minimum soil slope for the wire center service area, expressed as degrees with 2 fractional digits.
- **Maximum Soil Slope (*Slope_Max_WC*):** Maximum soil slope for the wire center service area, expressed as degrees with 2 fractional digits.

Wire Center Information File (*ssWCINFO.CSV*)

There is one record per wire center, in ascending order by wire center switch 11-character CLLI code. The data fields are these:

- **Wire Center Switch CLLI (*SWCLI*):** The 11-character code identifying the wire center and its service area.
- **Operating Company Number (*OCN*):** Number of the operating company
- **Operating Company Name (*Oper_Company*):** Name of the operating company
- **Central Office Type (*Switch_Type*):** Type of the central office (H=Host, R=Remote)

CBG-to-Grid Equivalence File (*ssAGGBG.CSV*)

There is one record per combination of Census Block Group and effective grid cell that overlays any part of it. These records are in the following order, major to minor, all ascending:

Switch CLLI Code
FDI Code
Census Block Group FIPS Code

Each record contains the following data fields:

- **Switch CLLI Code (*SWCLI*):** 11-character CLLI code identifying the wire center to which this record belongs.
- **Central Latitude of Effective Grid Cell (*CentLat*):** Latitude of the nominally central point of the effective grid cell, presented as degrees with 4 fractional digits.

- **Central Longitude of Effective Grid Cell (*CentLong*):** Longitude of the nominally central point of the effective grid cell, presented as degrees with 4 fractional digits.
- **FDI Code (*FDICode*):** FDI Code for the effective grid cell.
- **Census Block Group FIPS Code (*CBG_FIPS*):** Standard code identifying a CBG.
- **Number of Business Lines (*BusLines*):** Count of Business Lines in the effective grid cell that were allocated from the specified Census Block Group.
- **Number of Business Firms (*BusFirms*):** Count of Business *Firms* in the effective grid cell that were allocated from the specified Census Block Group.
- **Number of Households (*HHlds*):** Count of Households in the effective grid cell that were allocated from the specified Census Block Group.
- **Number of Housing Units (*HUnits*):** Count of Housing Units in the effective grid cell that were allocated from the specified Census Block Group.

Telephone Companies' File (*TELCOS.CSV*)

This file is a single file for the entire country. It is in order by Operating Company Name, ascending. The data fields are:

- **Operating Company Number (*OCN*):** "OCN"
- **Operating Company Name (*Oper_Company*):** Name as it appears in Wire Center Information file.
- **Parent Company Name (*Parent_Company*):** Name of its parent company.
- **Company Size (*Parent_Size*):** (S=Small, M=Medium, L=Large)

APPENDIX B

BCPM 3.0 PROCESSING STEPS

This paper describes the steps in processing BCPM 3.0 data. Processing occurs state-by-state.

Step 1: Create Appropriate Wire Center Service Areas Table

Program: MapBasic **B2WCSA**

Tables/Files Used: **CDDrive:\aa\aaWCSA**, BLR wire center boundaries

Tables/Files Produced: **basepath\aa\aaWCSA**, Effective BLR wire center boundaries

This program selects wire center boundaries for which the central office is *within* the state. It sorts them into CLLI-8 ascending order and writes the resulting table to the base directory.

Step 2: Determine Counties Covered by Wire Centers of a State

Program: MapBasic **B2WCCNTY**

Tables/Files Used: **basepath\aa\aaWCSA**, wire center boundaries

basepath\USCNTYHR, high resolution county boundaries

Tables/Files Produced: **basepath\aa\aaWCCOS.TXT**, ASCII text list of counties required

This program determines the counties covered by a state's wire centers. These will typically be all counties of the subject state, but can also be several counties from one or more adjacent states.

The program considers a county should to be included if at least 2% of that county's area is intersected by the set of wire center boundaries for the state.

The resulting ASCII text file is produced in ascending state/county FIPS code sequence.

Step 3: Determine the Switches for the Wire Center Service Areas

Program: MapBasic **B2WCSWS**

Tables/Files Used: **basepath\aa\aaWCSA**, wire center service area boundaries

basepath\LERG7U, all unique switches defined in LERG

Tables/Files Produced: **basepath\aa\aaWCSWS**, switches for state wire centers

This program determines the switches that qualify. There may be more than one per wire center boundary. But there *must* be at least one per wire center boundary ... if there is not, the program issues an error message.

Invariably, some exceptions, indicated by one or more messages in the message box, must be dealt with manually. This *could* require a further reordering of the **aaWCSWS** table, which must be in WCCLI/SWCLI name order.

Step 4: Generate 1/200th Degree Grid Cells for Each Wire Center Service Area

Program: MapBasic **B2WCGRID**

Tables/Files Used: **basepath\aa\aaWCSA**, wire center boundaries

basepath\aa\aaWCSWS, wire center switches

Tables/Files Produced: **basepath\aa\aaWCGR**, grid cells for all wire centers of the state

basepath\aa\B2LOG, ASCII text log file of errors encountered

The **aaWCGR** table consists of 1/200th degree grid cells as MapInfo regions, each of which is (if necessary) cut to precisely fit within wire center boundaries ... thus not all of these regions are true "square" grids.

Each record of this table contains the CLI code of its wire center, and the latitude and longitude of the numerical centerpoint of the grid cell that is represented by the record.

Mutually distinct parts of the same 1/200th degree grid may appear in different (adjacent) wire centers.

The resultant records are in order by wire center CLI / switch CLI (whatever the order of the input **aaWCSWS** table), and within a wire center / switch area, by ascending latitude (major) and ascending longitude (minor).

If MapInfo has an error when cutting the grid cells, a log – **B2aaLOG** – is produced indicating the errors, and the program corrects / fixes those errors.

Step 5: Assign the Minimum Bounding Rectangle for Each Switch's Area

Program: MapBasic **B2SWMBR**

Tables/Files Used: **basepath\aa\aaWCGR**, wire center grid cells

Tables/Files Used/Affected: **basepath\aa\aaWCSWS**, switches for state wire centers

This program determines, from the assigned grid cells, the minimum bounding rectangle (MBR) for the area covered by each of the switches, and updates the switches file with those 4 values.

Step 6: Fully Format the Grid Cell Records

Program: MapBasic **B2FMWCGR**

Tables/Files Used/Affected: **basepath\aa\aaWCGR**, grid cells for wire centers

This program just adds all additional columns in the **aaWCGR** table required for succeeding processes.

Step 7: Set the Record Number in the aaWCGR Records

Program: DOS C-Program **B2RCDNBR**

Tables/Files Used/Affected: **basepath\aa\aaWCGR**, wirecenter grids

The two parameters to this program are *StateAbbr* and *BasePath*. The program updates the records in place.

Step 8: Collect the Terrain Data for All States Served by This State's Wire Centers

Program: MapBasic **B2BGTRN**

Tables/Files Used: **CDdrive:\CBGSOILS\aaBGSOILS**, Terrain Data by Block Group

Tables/Files Produced: **basepath\aa\aaWCSOIL**, terrain data for all block groups served

This program uses the Stopwatch Maps *State Terrain Data by Census Block Group* product as its source. It copies to a table on hard disk the terrain data for all block groups of all states served by this state's wire centers. That table is used in the next step.

Step 9: Determine Area Overlap of Terrain Data

Program: MapBasic **B2GRTRN**

Tables/Files Used: **basepath\aa\aaWCSOIL**, terrain data for all block groups served

Tables/Files Used/Affected: **C:\TEMP\GRBGX**, a temporary table

This program joins information in these two tables, writing it to a temporary table on the local drive **C:\TEMP\GRBGX**. It then ends, often with an *Error Overlaying Objects*.

Step 10: Assign Terrain Data to Each Grid Cell

Program: DOS C-Program **B2GRBG2**

Tables/Files Used: **C:\TEMP\GRBGX**, a temporary table

Tables/Files Used/Affected: **basepath\aa\aaWCGR**, wire center grid cells

This program actually performs the assignment to the grid cells. Run it from the base directory, with two arguments: *StateAbbr* and *BasePath*.

Step 11: Collect the Census Block Boundaries for the State's Wire Centers

Program: MapBasic **B2ALLCBS**

Tables/Files Used: **basepath\aa\aaWCCOS.TXT**, ASCII text list of counties required
CDdrive:\CBBY\aa\CBssccc, Census Block Boundary tables on CD
basepath\aa\aaWCSA, wire center service areas

Tables/Files Produced: **basepath\aa\aaWCCBS**, Census Block Boundaries for all these WCs

This program uses the list of counties required to direct the operator to mount the one or more CD-ROMs containing the Census Block boundaries for the required counties (some of which may be outside the subject state). It produces a table of all Census Block boundaries within the purview of the subject state's wire centers.

Step 12: Collect the Census Block-Level Housing Data

Program: DOS Batch File **B2CBDEMS.BAT**

DOS C-Program **C:\UTIL\CSVTOTAB.EXE**, plus other utilities

Tables/Files Used: **basepath\BXDEMS.DEF**, ASCII text file definition

CDdrive:\XBLK\BXssccc, STF1B extract files

Tables/Files Produced: **basepath\aa\aaCBDEMS**, Census Block housing demographics

This batch file, file conversion utility program, and assorted other utility programs generate a table containing, for each occupied Census Block in any county (of any state) touched by one of this state's wire centers, the base housing demographics, including a 3-way distribution of housing units by structure size. At this point, this is unadjusted 1990 Census data.

Step 13: Collect the Block Group-Level Units-in-Structure Distribution Data

Program: MapBasic **B2BGHUS**

Tables/Files Used: **CDdrive:\BLOCK\REPaaG01**, Claritas BG Units in Structure by State

Tables/Files Produced: **basepath\aa\aaBGHUS**, resulting table for all BGs touched by WCs

This program copies the BG-level units-in-structure data, for Block Groups in all states touched by this state's wire centers, to a table, in FIPS order.

Step 14: Apply All Housing Unit Demographics to Census Block Table

Program: MapBasic **B2UPCBHU**

Tables/Files Used: **basepath\aa\aaCBDEMS**, Census Block housing demographics
basepath\aa\aaBGHUS, BG units-in-structure
basepath\POPADJ.TXT, 1995 census adjustment factors by county
Tables/Files Affected: **basepath\aa\aaCBS**, Census Blocks table

This program applies the housing unit information from the above tables and file to the Census Blocks.

Step 15: Apply Business Lines/Firms Data to Census Block Table

Program: MapBasic **B2UPCBBU**

Tables/Files Used: **basepath\aa\aaWCCOS.TXT**, ASCII text list of all counties touched
basepath\ss\ssPNRCB, CB-level businesses for all states touched
basepath\ss\ssPNRBG, BG-level businesses for all states touched
basepath\ss\ssPNRTR, TR-level businesses for all states touched

Tables/Files Used/Affected: **basepath\aa\aaCBS**, Census Blocks table

This program first collects PNR data for all counties touched into work files **C:\TEMP\PNRCB**, **C:\TEMP\PNRBG**, and **C:\TEMP\PNRTR**, sorted to FIPS order. It then applies that data to the Census Blocks file.

Step 16: Collect the Roads for a State's Wire Centers as MID/MIF Files

Program: DOS Batch File **B2TGRMIF**

DOS C-Program **B2TGRRDS.EXE**, plus other utilities

Tables/Files Used: **basepath\aa\aaWCCOS.TXT**, ASCII text list of all counties touched
CDdrive:\TIGER94x\ss\CBssccc.xxx, TIGER94 files

Tables/Files Produced: **basepath\aa\aaSTSSsccc.MID/MIF**, importable files per county

This process creates, from TIGER94 CDs, the roads for all counties (in all states) touched by this state's wire centers.

Step 17: Import Roads MID/MIF Files to a MapInfo Table

Program: MapBasic **B2ALLRDS**

Tables/Files Used: **basepath\aa\aaWCCOS.TXT**, ASCII text list of all counties touched
basepath\aa\aaSTSSsccc.MID/MIF, importable files per county

Tables/Files Produced: **basepath\aa\aaRDS**, Census Blocks table

This program imports and collects all the above files into a single MapInfo table. When you are satisfied that the process is successful, you may erase the MID/MIF files, and the temporary **aaRD0** table.

Step 18: Relate Roads and Census Blocks

Program: DOS C-Program **B2CBRDS**

Tables/Files Used/Affected: **basepath\aa\aaRDS**, roads for the entire state
basepath\aa\aaCBS, Census Blocks table

This DOS program (whose two parameters are *StateAbbr* and *BasePath*) determines and posts the total road segment lengths for each Census Block, and tags the Roads records with the WCCLI code of the Census Block and the indication as to whether the CB is large, small, or empty.

Step 19: Create the Valid Roads Table and the Roads-In-Large-Census-Blocks Table

Program: MapBasic **B2SPLRDS**

Tables/Files Used: **basepath\aa\aaRDS**, roads for the entire state
basepath\aa\aaCBS, Census Blocks table

Tables/Files Produced: **basepath\aa\aaVLDRDS**, valid roads for state
basepath\aa\aaLCBRDS, roads for state in large Census Blocks

This program creates the two working Roads tables from the original.

Step 20: Determine Area Overlap of Smaller Census Blocks with Grid Cells

Program: MapBasic **B2SCBXGR**

Tables/Files Used: **basepath\aa\aaCBS**, Census Blocks table
basepath\aa\aaWCGR, wire center grid cells

Tables/File Produced: **basepath\aa\aaSCBxGR**, small Census Block/microgrid join

This program determines the area overlap between microgrid cells and Census Blocks less than 0.25 square miles in size. This relationship will be used in the next step to allocate demographics from those Census Blocks to the overlaid grid cells.

If MapInfo stops this program with an *Error overlaying the objects*, you should save the SCBXGR temporary table as **basepath\aa\aaSCBxGR** and end the program.

Step 21: Allocate Demographic Data from Small Census Blocks to Microgrids

Program: DOS C-Program **B2ALLOSM.EXE**

Tables/Files Used: **basepath\aa\aaSCBxGR**, small Census Block/microgrid join
basepath\aa\aaCBS, Census Blocks

Tables/Files Affected: **basepath\aa\aaWCGR**, wire center grid cells

This program uses the relationships determined above to add area-proportional Census Blocks demographics to the overlaid grid cells.

Step 22: Determine Road Segment Overlap of Larger Census Blocks with Grid Cells

Program: MapBasic **B2LCBXGR**

Tables/Files Used: **basepath\aa\aaLCBRDS**, large Census Block road segments
basepath\aa\aaWCGR, wire center grid cells

Tables/File Produced: **basepath\aa\aaLCBxGR**, large Census Block road/microgrid join

This program determines the area overlap between microgrid cells and road segments of Census Blocks larger than 0.25 square miles in size. This relationship will be used in the next step to allocate demographics from those Census Blocks to the overlaid grid cells.

If MapInfo stops this program with an *Error overlaying the objects*, you should save the LCBXGR temporary table as **basepath\aa\aaLCBxGR** and end the program.

Step 23: Allocate Demographic Data from Large Census Blocks to Microgrids

Program: DOS C-Program **B2ALLOLG.EXE**

Tables/Files Used: **basepath\aa\aaLCBxGR**, small Census Block/microgrid join
basepath\aa\aaCBS, Census Blocks

Tables/Files Affected: **basepath\aa\aaWCGR**, wire center grid cells

This program uses the relationships determined above to add road-length-proportional Census Blocks demographics to the overlaid grid cells.

Step 24: Calculate Road Information for Micro-grids

Program: MapBasic **B2RDNFO**

Tables/Files Used/Affected: **basepath\aa\aaVLDRDS**, Valid Roads table
basepath\aa\aaWCGR, wire center grid cells

Tables Produced: **basepath\aa\aaGRxRD**, grid/road table

This program calculates the road centroid, total length of intersecting roads, and the road area for each Micro-grid.

Step 25: Aggregate Micro-grids

Program: DOS C-Program **B2WCAGG**

Tables/Files Used/Affected: **basepath\aa\aaWCSWS**, switches for state wire centers
basepath\aa\aaWCGR, wire center grid cells

Tables/Files Produced: **basepath\aa\aaAGG**, aggregate grids
